

**TRICYCLE WITH GEARED AUXILIARY
STEERING MECHANISM**

ABSTRACT OF THE DISCLOSURE

10 A tricycle features a hollow main frame member to which a pair of rear wheels and a seat
are mounted. A head tube is attached to the main frame member and a post is pivotally
positioned therein. The tricycle front wheel is connected to the lower end of the post while
handlebars are connected to the upper end of the post. A steering mitre gear is also attached to
the post within the head tube. A steering shaft is rotatably positioned with the hollow main
15 frame member and features mitre gears on its leading and trailing ends. The mitre gear on the
leading end engages the steering mitre gear while the mitre gear on the trailing end engages a
mitre gear that is removably engaged by a pushing and steering handle. The tricycle thus may be
pushed and steered by the handle.
